

# 360° one-shot body scan for improved performance diagnostics

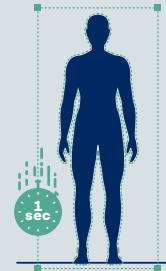

**To best prepare athletes for peak performance, minimize the risk of injury and support back-to-sport processes, a reliable and precise assessment of body status and fitness level is key.**

With its new 3D body scan platform BodyLoop, VITRONIC offers precise, versatile and intuitive scanning performance. The proven technology provides 360° one-shot images (<1sec recording time) that result in reliable and relevant body data through the use of very powerful software. The body scans are absolutely repeatable and allow all body measurements such as circumferences and volumes, a comprehensive posture analysis as well as a development analysis of the athlete over time.

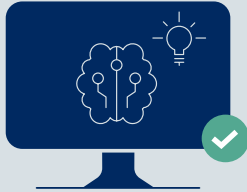

## Benefits

3D full-body scanning for comprehensive body analysis

Fast scans in less than 1 sec – comfortable for athletes and ideal for entire sports teams

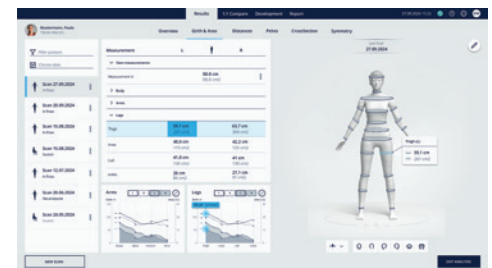

Simple, intuitive technology that can be used without intensive training or experience

Accurate, repeatable measurement suitable for performance development, sports medical treatments, statistical evaluations and biomechanical studies

## The top athlete among body scanners

For competitive sport and competitors to progress, performance diagnostics must be just as professional as the athletes themselves. VITRONIC's 3D full-body scanner with photogrammetry has been specifically designed for this field. Advanced analysis software enables automatic body measurement of athletes within a second and offers innovative tools to evaluate their physiognomy – including circumferences and volumes, posture and body development over time. The technology is intuitive and easy to use, so that sports teams, sporting bodies and biomechanics labs can easily integrate it into their processes – without time-consuming training. What's more, the results are absolutely reliable. That means reproducible and precise. As a result, they can be the foundation for goal-oriented athlete development – whether it's about performance, prevention or rehabilitation.

## Proven: experience and scientific quality

The accuracy and reliability of the technology is demonstrated by its predecessor, the Vitus body scanners. These scanning solutions have been an internationally recognized reference on the market for over 30 years. They are utilized in many relevant sectors – from biomechanics, sports science and ergonomics to medicine, where their data is used as ground truth in many studies. This experience gained in close cooperation with users is just as much the basis of the new BodyLoop scanner as the advanced technology.
